

CLAIMS

What is claimed is:

1. An apparatus for baling a standing tree comprising:
 - a first frame defining a central area to receive a lower trunk portion of a tree;
 - a second frame is mounted for rotation around the central area;
 - at least one string dispenser mounted to the second frame;
 - a motor that rotates the second frame around the central area such that string is wound around the tree; and

An elevatable support attached to the apparatus for raising the apparatus upwards on the tree.
